

PHOTOSHOP TUTORIAL

TEETH WHITENING

1. After opening your photo, select the teeth with one of the selection methods. (Magnetic Lasso Tool or Quick Selection Tool) Make sure the selection does not include any gums or lips.
2. Refine your selection in Quick Mask Mode (the last button on the Tools panel)
3. Copy the selection to a new layer. (Ctrl+C to Copy, Ctrl+V to Paste)
4. Click on the new layer.
5. Increase the brightness by going to Image > Adjustments > Brightness/Contrast (This should be a subtle change)
6. Next, open the Hue/Saturation window. (Image > Adjustments > Hue/Saturation)
7. You can increase the Lightness and remove most or all of the saturation.
8. If the teeth look a little too fake, then in the Layers panel, lower the opacity until they look natural.

THAT'S ALL THERE IS TO CREATING A NICE WHITE SMILE!
